This tutorial will teach you the basics of building an ASP.NET MVC Web application using Microsoft Visual Web Developer 2010 Express, which is a free version of Microsoft Visual Studio. Before you start, make sure you've installed the prerequisites listed above. You can install all of them using the [Web Platform Installer](#).

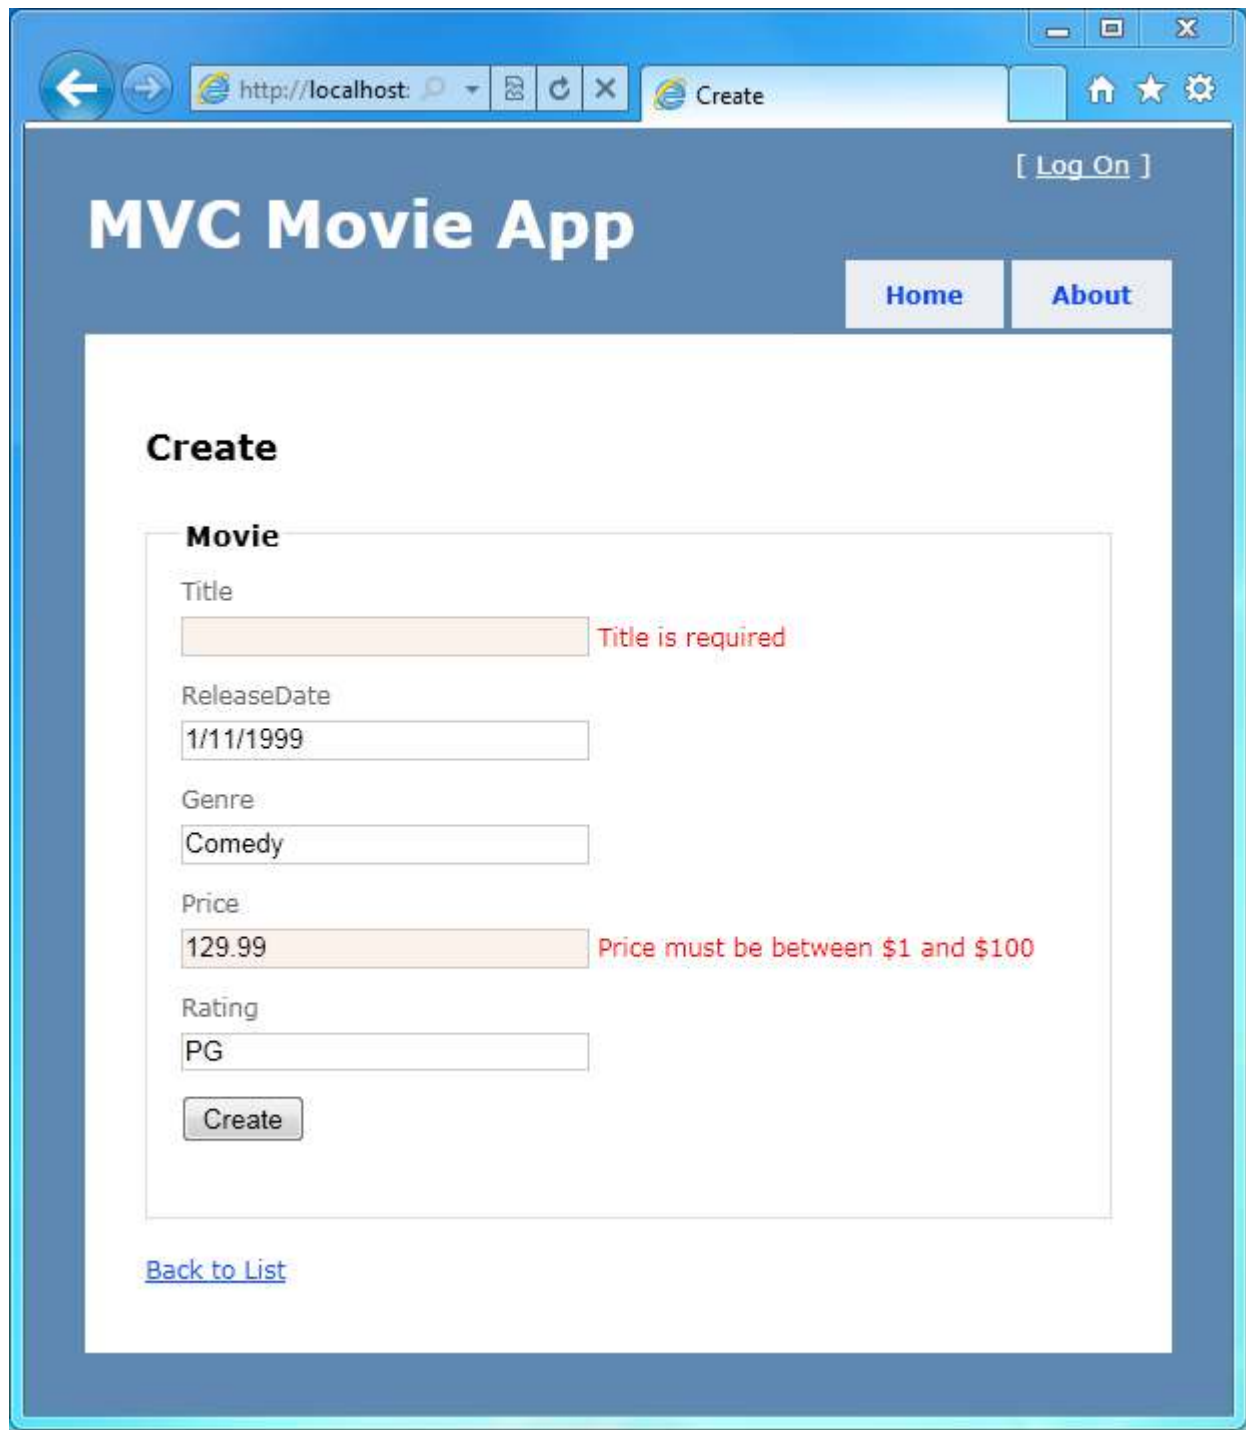

A Visual Web Developer project with C# source code is available to accompany this topic. [Download the C# version here](#). If you prefer Visual Basic, switch to the [Visual Basic version](#) of this tutorial.

What You'll Build

You'll implement a simple movie-listing application that supports creating, editing and listing movies from a database. Below are two screenshots of the application you'll build. It includes a page that displays a list of movies from a database:

The application also lets you add, edit, and delete movies as well as see details about individual ones. All data-entry scenarios include validation to ensure that the data stored in the database is correct.
