Pointers and Arrays

We've seen examples of both of these in our LC-3 programs; now we'll see them in C.

Pointer

- Address of a variable in memory
- Allows us to <u>indirectly</u> access variables
 - in other words, we can talk about its *address* rather than its *value*

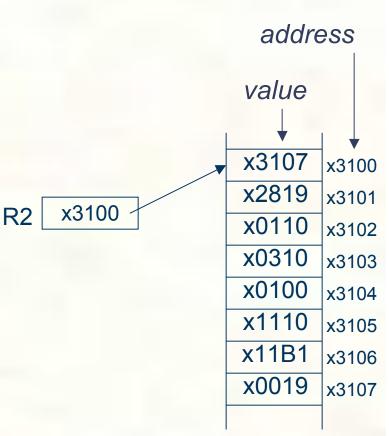

Array

- A list of values arranged sequentially in memory
- Example: a list of telephone numbers
- Expression a [4] refers to the 5th element of the array a

Address vs. Value

- Sometimes we want to deal with the <u>address</u> of a memory location, rather than the <u>value</u> it contains.
- Recall example from Chapter 6: adding a column of numbers.
- R2 contains address of first location.
- Read value, add to sum, and increment R2 until all numbers have been processed.
- R2 is a pointer -- it contains the address of data we're interested in.

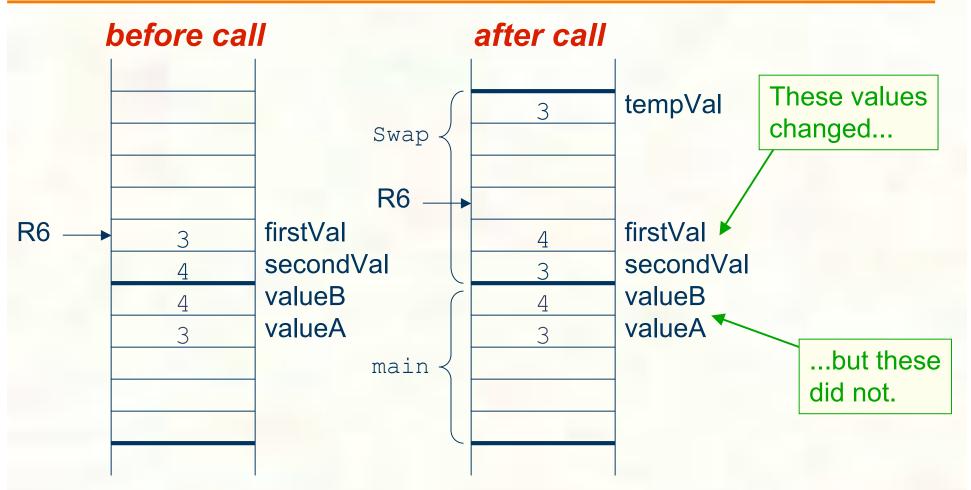

Another Need for Addresses

Consider the following function that's supposed to swap the values of its arguments.

```
void Swap(int firstVal, int secondVal)
{
    int tempVal = firstVal;
    firstVal = secondVal;
    secondVal = tempVal;
}
```

Executing the Swap Function

Swap needs <u>addresses</u> of variables outside its own activation record.
