Notes for Professionals

Chapter 12: DateTime

Section 12.1: DateTime from string

`DateTime.parse` is a very useful method which constructs a `DateTime` from a string, guessing what you want.

```
DateTime.parse('Jun 5 2016')
#=> #<DateTime: 2016-06-05T00:00:00+02:00 ((2457580), #<DST>, +01, 22991613>
DateTime.parse('2016-06-05T00:00:00')
#=> #<DateTime: 2016-06-05T00:00:00+00:00 ((2457580), #<DST>, +00, 22991613>
DateTime.parse('2016-06-05T00:00:00+00:00')
#=> #<DateTime: 2016-06-05T00:00:00+00:00 ((2457580), #<DST>, +00, 22991613>
DateTime.parse('2016-06-05T00:00:00-00:00')
#=> #<DateTime: 2016-06-05T00:00:00-00:00 ((2457580), #<DST>, -01, 22991613>
DateTime.parse('2016-06-05T00:00:00-01:00')
#=> #<DateTime: 2016-06-05T00:00:00-01:00 ((2457580), #<DST>, -01, 22991613>
DateTime.parse('2016-06-05T00:00:00-02:00')
#=> #<DateTime: 2016-06-05T00:00:00-02:00 ((2457580), #<DST>, -02, 22991613>
```

Note: There are lots of other formats that `parse` recognizes.

Section 12.2: New

```
DateTime.now(2014,10,1)
#=> #<DateTime: 2014-10-10T00:00:00+02:00 ((2457580), #<DST>, +01, 22991613>
```

Current time:

```
DateTime.now
#=> #<DateTime: 2016-08-04T00:43:59-03:00 ((2457980), #<DST>, -01, 22991613>
```

Note that it gives the current time in your timezone.

Section 12.3: Add/subtract days to DateTime

```
DateTime + Fixnum days quantity
#=> #<DateTime: 2015-12-28T23:59:59+01:00 ((2457580), #<DST>, +01, 4910880)
```

Chapter 14: Numbers

Section 14.1: Converting a String to Integer

You can use the `Integer` method to convert a `String` to an `Integer`:

```
Integer('123')    #=> 123
Integer('10F')    #=> 255
Integer('010')    #=> 4
Integer('0505')   #=> 365
```

You can also pass a base parameter to the `Integer` method to convert numbers from a certain base:

```
Integer('101', 5)  #=> 5
Integer('74', 8)    #=> 60
Integer('10M', 16)  #=> 365
```

Note that the method raises an `ArgumentError` if the parameter cannot be converted:

```
Integer('Hello')
# raises ArgumentError: invalid value for Integer(): "Hello"
Integer('23>Hello')
# raises ArgumentError: invalid value for Integer(): "23>Hello"
```

You can also use the `String#to_i` method. However, this method is slightly more permissive and has a different behavior than `Integer`:

```
'23'.to_i    #=> 23
'23>Hello'.to_i #=> 23
'Hello'.to_i  #=> 0
```

`String#to_i` accepts an argument, the base to interpret the number as:

```
'10'.to_i(2) #=> 2
'10'.to_i(3) #=> 3
'1A'.to_i(16) #=> 16
```

Section 14.2: Creating an Integer

```
0      # creates the Fixnum 0
123   # creates the Fixnum 123
1_000  # creates the Fixnum 1000. You can use _ as separator for readability.
```

By default the notation is base 10. However, there are some other built-in notations for different bases:

```
0xFF    # hexademical representation of 255, starts with 0x
0b1000  # binary representation of 4, starts with 0b
0xFFFF  # octal representation of 365, starts with 0 and digits
```

Section 14.3: Rounding Numbers

The `round` method will round a number up if the first digit after its decimal place is 5 or higher and round that digit if 4 or lower. This takes in an optional argument for the precision you're looking for.

Ruby Notes for Professionals

Chapter 18: Methods

Functions in Ruby provide organized, reusable code to perform a set of actions. Functions simplify the coding process, prevent redundant logic, and make code easier to follow. This topic describes the declaration and utilization of functions, arguments, parameters, yield statements and scope in Ruby.

Section 18.1: Defining a method

Methods are defined with the `def` keyword, followed by the method name and an optional list of parameter names in parentheses. The Ruby code between `def` and `end` represents the body of the method.

```
def hello(name)
```

```
  puts "Hello, #{name}"
```

```
end
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

```
hello("World")
```

```
#=> "Hello, World!"
```

When the receiver is not explicit, it is `self`.

Parameter names can be used as variables within the method body, and the values of these named parameters come from the arguments to a method invocation.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

Parameter names can be used as variables within the method body, and the values of these named parameters come from the arguments to a method invocation.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```

```
hello("Alli")
```

```
#=> "Hello, Alli!"
```

A method invocation specifies the method name, the object on which it is to be invoked (sometimes called the receiver), and zero or more argument values that are assigned to the named method parameters.

When the receiver is not explicit, it is `self`.

```
hello("World")
```

```
#=> "Hello, World!"
```
